

What to Know About the Study Behind the Push to Ban Gas Stoves

Media Mentions

January 11, 2023 | *Washington Examiner* | 1 minute read | Washington, DC

A study, conducted by the environmental think tank RMI and published in the *International Journal of Environmental Research and Public Health*, found that as many as 650,000 current cases of childhood asthma are the result of gas stove use.

Bracewell Policy Resolution Group Senior Principal **Frank Maisano** pointed out to the *Washington Examiner* that the study did not distinguish between gas stoves and other environmental factors that could contribute to a diagnosis.

Maisano said there are many factors that can cause asthma in one's everyday life, including indoor and outdoor environments, mold, and habits of individual families.

"There's so many factors involved — you can't just claim that 12% of asthma cases [are] related to a gas stove. You just can't do that," he said. "And maybe in some scenarios, it is [the cause]. And maybe in other scenarios, it's not."
